

SIT313 Secure Frontend Applications

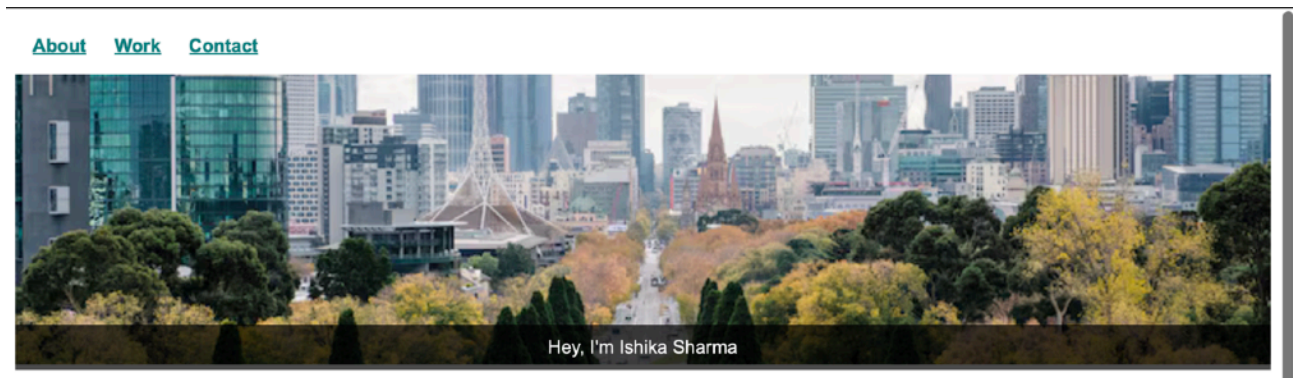

P1 Personal Website

Personal Website Summary

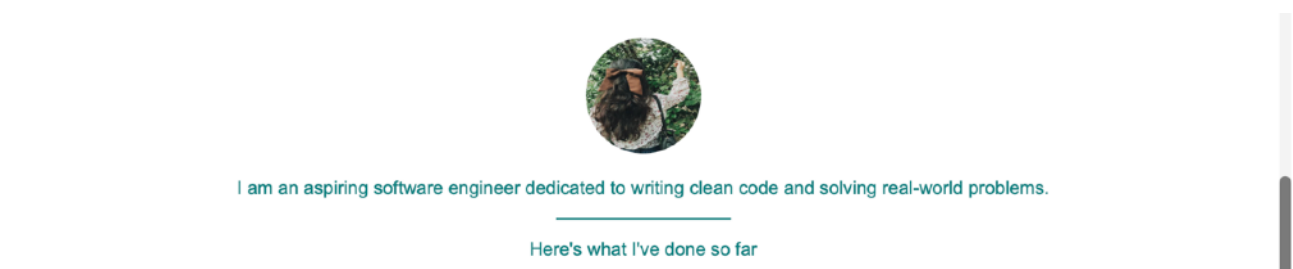

- **Navigation Bar & Banner:** Created a top-aligned navigation menu using semantic `<nav>` elements linking to `#about`, `#work`, and `#contact`. Integrated a banner image that triggers a dark overlay with the hover text *"Hey, I'm Ishika Sharma"*.
- **Author Profile:** Styled a centred profile section featuring a circular headshot image, a teal divider line, and a bio.
- **Portfolio Display:** Two distinct projects, each accompanied by preview thumbnails and GitHub repository links.
- **Responsive Image Gallery:** Built a photo gallery using CSS Flexbox (flex-wrap: wrap) ensuring images automatically shift position and resize responsively whenever the browser window is adjusted.

Here's what I've done so far

Project 1: SIT210

This project has two distinct embedded systems projects: an Automated Smart Light System to automatically turn on a light, and a Temperature & Humidity Monitor that utilizes a DHT22 sensor to accurately measure and track real-time climate data.

Project 2: HTML

This is my beginner-friendly HTML code that builds a clean webpage. This is very helpful for learning from basics and is easy to grasp. Practice of this will be very helpful in future.
